

ABSTRACT OF THE DISCLOSURE

The invention provides a nutrient composition for augmenting immune strength or physiological detoxification. The nutrient composition consists of an optimal combination of an effective amount of at least one vitamin antioxidant, at least one mineral antioxidant and a highly saturable amount of at least three high potency antioxidants. The at least one vitamin antioxidant can be vitamin C, bioflavonoid complex, vitamin E, vitamin B6 or beta-carotene and the at least one mineral antioxidant can be zinc or selenium. The at least three high potency antioxidants can be alpha lipoic acid, acetyl L-carnitine, N-acetyl-cysteine, co-enzyme Q10 or glutathione. Also provided is a nutrient composition for augmenting immune strength or physiological detoxification that consists of an optimal combination of an effective amount of at least three vitamin antioxidants, at least two mineral antioxidants and a highly saturable amount of at least three high potency antioxidants. Further provided is a method of stimulating immune system function or a method of augmenting a therapeutic treatment of a disease. The method consists of administering to an individual a nutrient composition of the invention one or more times a day over a period of about 5-7 weeks, the immune system function being stimulated to result in an increase of CD4+ cells of at least about 15% compared to pre-administration levels. A method of stimulating a physiological detoxification function of an individual or a method of augmenting a therapeutic treatment of a disease is also provided. The method consists of administering to an individual a nutrient composition of the invention one or more times a day over a period of about 5-7 weeks, the physiological detoxification function being stimulated to result in a decrease of one or more free radical markers by about 20% compared to pre-administration levels.
